

Assignment-6

Name: Anuska Nath

Roll: 002311001003

Dept: Information Technology

Year: UG3

Simulation of Cloud Movement

1. Document Preparation and Organization:

The project began by opening a new document in Macromedia Flash to create an animation workspace.

The stage was prepared by creating a sky background using a blue fill in Layer 1. Proper layer organization was maintained by naming and arranging layers for background and clouds.

2. Cloud Creation and Design:

A new layer (Layer 2) was inserted to draw the first cloud using the Pencil Tool.

The cloud shape was filled with white color using the Paint Bucket Tool to give it a realistic appearance.

The cloud was then selected completely (including fill and outline), grouped, and converted into a symbol (Movie Clip) for animation purposes.

3. Additional Clouds and Layer Management:

Existing clouds were duplicated and repositioned, or new clouds were drawn using the Pencil Tool.

Each cloud was converted into a separate symbol (e.g., cloud2, cloud3) to allow independent movement and better control during animation.

4. Effect Application and Enhancement

To improve the visual quality, a glow effect was applied to each cloud.

This was done by selecting the cloud and navigating to Filters → Glow, where the color was set to white.

Blur X and Blur Y values were adjusted to achieve a soft and natural cloud effect.

5. Animation using Motion Tween

Keyframes were inserted at the beginning and end of the timeline in the cloud layers.

Motion tween was applied to create smooth movement of clouds across the sky.

The clouds were repositioned in the final frame to simulate horizontal movement.

The background layer remained static, with frames extended instead of animated.

Frame 1:

Frame 40:

Frame 80:

6. Testing and Output

The animation was tested using Control → Test Movie to preview the movement.

The clouds moved smoothly across the stage, creating a realistic sky animation effect.

7. Observation

- Clouds moved smoothly when proper motion tweening was applied.
- Converting shapes into symbols ensured that the entire object moved together without distortion.
- Using multiple layers allowed better control over animation elements.

8. Result

The simulation of cloud movement was successfully created. Multiple clouds moved across the sky at different positions, enhancing the realism of the animation.
